

Maximum Productivity Package

The Maximum Productivity Package maximizes oven utilization by allowing the operator to prepare a second batch of glass while the first batch is in the oven. While the first batch is in the oven, one transfer deck stands by empty, ready for the glass to be unloaded from the oven when complete. Meanwhile, a second batch of glass is being prepared and loaded onto a second transfer deck, then connected to a second set of vacuum pumps, so air can be removed in advance. When the first load is complete, it is unloaded onto the empty transfer deck. The second batch is then placed into the oven and production continues. Package includes items identified below.
